

Variety Description

Variety

ANJO

Species	Timothy grass
Botanical name	Phleum pratense
Ploidy	2
Seeding rate	15 kg/ha
Distance between rows	as cereals
Sowing period	April to August
Sowing depth	1–2 cm

Agronomic figures*:

Heading	4
Development after sowing	5
Tendency to winterkilling	4
Tendency to lodging	7
Susceptibility to leaf spots	4
Persistence	6
Sward density	5
DM-yield total	5
DM-yield first cut	4
DM-yield in aftermath	5

Clarification of figures*:

1: very early, very low / 5: medium / 9: very late, very high

* **Source:** Cultivator classification

Variety description

The Timothy grass variety ANJO is characterised by its high persistence and good winter-hardiness. Another advantage is its even yield distribution. The rapid mass formation in the early development ensures that the grass establishes well.

Most important characteristics

Quick leaf development [youth stage]
Highly competitive
Extremely winter-hardy and very easily digestible

Usage

With a feed value of 8, Timothy grass is suitable for growing on meadows as well as pastures. It tolerates multiple cuts, even if the regrowth is rather weak. Timothy grass is extraordinarily winter-hardy and extremely persistent, which makes it suitable for many grassland mixtures.
