

# Variety Description

## Variety

## SELISTA

### Species

Smooth-stalked meadow grass

### Botanical name

*Poa pratensis*

### Ploidy

2

### Seeding rate

15 kg/ha

### Distance between rows

as cereals

### Sowing period

until late August

### Sowing depth

1–2 cm

### Agronomic figures\*:

Panicle formation 5

Development after sowing 6

Tendency to winterkilling 5

Susceptibility to rust 2

Persistence 6

Sward density 5

DM-yield total 5

DM-yield first cut 5

DM-yield in aftermath 5

### Clarification of figures\*:

1: very early, very low / 5: medium / 9: very late, very high

## Variety description

SELISTA is a newly registered variety of smooth-stalked meadow grass with outstanding agronomic performance. Its outstanding rust resistance (grade 2) and high persistence make SELISTA an impressive variety. SELISTA is also an important ingredient in many grassland mixtures thanks to its good sward density and high yields throughout the year.

## Most important characteristics

High mass formation after sowing and rapid stand establishment  
Extremely high rust resistance (grade 2)  
High persistence  
Even yield distribution

## Usage

Smooth-stalked meadow grasses produce underground runners in order to develop extremely high sward density. At the same time, they are also very trample-resistant. This sod grass, with productivity value 8, is also very winter-hardy and extremely persistent. It is particularly suitable for dry locations with intensive cropping, which for instance is essential on grasslands that are either grazed or mowed.
