

Variety Description

Variety

ALTASWEDE

Species	Red clover
Botanical name	Trifolium pratense
Ploidy	4
Seeding rate	25-30 kg/ha
Distance between rows	as cereals
Sowing period	March to August
Sowing depth	1-2 cm

Variety description

Rich in leaves and protein content, the red clover variety ATLASWEDE is a late bloomer of Canadian origin. These features afford it high winter hardiness, which is particularly valued in northern and western Europe. ATLASWEDE provides its main yield in the first growth of the first main harvest year. It also fares well in terms of low susceptibility to diseases.

Most important characteristics

Uniform yield distribution
High protein content
Low winterkilling
Low susceptibility to diseases

Usage

Red clover is a perennial to persistent clover species, which thrives best in humid to moderate climates. It prefers calcareous soils with pH values of 5.1 to 6.7. The seedbed should meet the needs of the small seeds. Red clover's main application is in arable feed crop production, where it is grown in ryegrass-dominated clover-grass mixtures rather than on its own. It is also well-suited for use in flowering, greening and green manure mixtures.

Suitable inoculant with appropriate rhizobia:
RhizoFix® RF-40
