Variety description

The variety EUROMIC is a specially bred white clover for lawns. It is characterized by an extremely low growth habit and almost no flower formation with regular use. EUROMIC is an excellent match for the standard lawn mixtures and is ideal for natural lawns. By using EUROMIC, the fertilization can be significantly reduced and the lawn supplies itself with the necessary nitrogen. EUROMIC has a high sward density and is able to reliably close existing gaps.

Most important characteristics

Ideal for extensive natural lawns
Optimal nutrient supply
Very low growth habit
High sward density
Very low tendency to flower

Usage

Also available as coated seed [Mantelsaat®].

Contains inoculated seed with suitable rhizobia for fast symbiosis and optimal nitrogen fixation.
