

Variety Description

Variety

SEVERKA

Species

White mustard for seed production

Botanical name

Sinapis alba

Ploidy

Diploid

Seeding rate

8-12 kg/ha

Distance between rows

Similar to cereals

Sowing period

Late March to early

April

Sowing depth

1-2 cm

Agronomic figures*:

Susceptibility to Beet nematodes

-

Development after sowing

7

Inclination to flower

9

Tendency to lodging

3

Grain yield

8

Oil yield

7

Oil content

5

Clarification of figures*:

1: very early, very low / 5: medium / 9: very late, very high

Variety description

SEVERKA is among the absolute top varieties when it comes to mustard cultivation for seed production. It exhibits an extremely high grain yield along with high oil content. In the 2009-2011 state variety tests in Thuringia, SEVERUS impressed evaluators as the highest yielding variety in all test years, with a relative yield of 118. Oil yield, at a relative value of 119, was also considerably higher than the average test varieties. SEVERIKA is characterised by uniform maturation and low tendency to waterlogging. Its susceptibility to diseases, particularly to sclerotinia, is also rated low.

Most important characteristics

Top variety in terms of grain and oil yield
Good stability
Good weed suppression
Uniform maturation
Low susceptibility to diseases
