

Variety Description

Variety

Species	White mustard
Botanical name	Sinapis alba
Ploidy	2
Seeding rate	25–30 kg/ha as catch crop
Distance between rows	as cereals
Sowing period	from late July to late August
Sowing depth	2–3 cm

Agronomic figures*:

Susceptibility to beet cyst nematodes	2
Development after sowing	8
Inclination to flower	3
Tendency to lodging	3

Clarification of figures*:

1: very early, very low / 5: medium / 9: very late, very high

Variety description

The distinguishing feature of this beet cyst nematode resistant variety is its excellent nematode reduction rate. Combined with rapid mass formation in the early development, this variety boasts of particularly beneficial agronomic properties. Because the plant covers the ground very quickly, development of weeds is successfully inhibited and suppressed. Among other things, the variety is best suited for strip-till because ACTION is extremely stable – a feature that plays a significant role in mulch sowing systems and is highly advantageous. In addition to that, it has a very low inclination to flower.

Most important characteristics

High stability
Nematode-resistant, grade 2
Very low inclination to flower
Very rapid mass formation in the early development
