

Variety Description

Variety

VULPERA

Species	Meadow foxtail
Botanical name	Alopecurus pratensis
Ploidy	4
Seeding rate	25 kg/ha
Distance between rows	as cereals
Sowing period	until late August
Sowing depth	1–2 cm

Agronomic figures*:

Heading	4
Development after sowing	7
Tendency to winterkilling	5
Tendency to lodging	7
DM-yield total	6
DM-yield first cut	6
DM-yield in aftermath	5

Clarification of figures*:

1: very early, very low / 5: medium / 9: very late, very high

Variety description

VULPERA is a meadow foxtail variety with extremely good mass formation after sowing. This variety is very winter-hardy and produces good overall yield. Yields from the first cut in particular are very high .

Most important characteristics

Very good mass formation after sowing
Good dry matter yields

Usage

Meadow foxtail generally grows on humid, nutrient-rich meadows and is characterised by very early flowering. The slow development ensures that full productivity is achieved only in the second year. With a feed value of 7, meadow foxtail is a high-grade variety and, together with early cutting, a particularly persistent one as well. With intensive fertilisation, it is possible to crop it four times and achieve high yields. In addition, meadow foxtail can also endure prolonged cold spells and snow cover very well.
